
Example

Two parallel wires with current flowing in the same direction, $i_1 = 2\text{ A}$ & $i_2 = 3\text{ A}$. Find the field at vertex the of 30-30-120 isosceles triangle.

Because the magnetic field is perpendicular to radii away from the wires, the angle between \vec{B} and the horizontal is $90^\circ - 30^\circ = 60^\circ$ (true for both \vec{B} s).

$$x: B_1 \cos 60^\circ + B_2 \cos 60^\circ = 1.25\ \mu\text{T}, \quad y: -B_1 \sin 60^\circ + B_2 \sin 60^\circ = 2.165\ \mu\text{T}$$

WARNING: HRW show a similar Sample Problem 29-2, but with a 45-45-90 triangle. It is *PURE COINCIDENCE* that their B_1 and B_2 come out to be perpendicular, and therefore can be combined with the Pythagorean Theorem. Not a general result!
